Aspiring AI Engineer specializing in applied ML, intelligent automation, AI pipelines, and data-driven problem solving.

Education

University of California, San Diego – B.S. in Artificial Intelligence Engineering — Expected June 2029
Relevant Coursework: Advanced Data Structures, Design and Analysis of Algorithms, Introduction to Probability and Statistics, Systems Programming & Software Tools, Computer Organization, Mathematics for Algorithms, Discrete Mathematics, Introduction to Artificial Intelligence
GPA: 3.516

Skills

Languages: Python, Java, C, C++, JavaScript, TypeScript, Assembly, HTML, CSS
Technologies: Git, Docker, Google Cloud, Azure, PostgreSQL, Snowflake, Databricks, Langchain, Pytorch, Scikit-learn, Tensorflow, Pandas, Plotly, Flask, Django, Microsoft Power Automate
Certifications: Google Cloud Fundamentals: Core Infrastructure (2024), Prompt Engineering with LangChain (2024), PCAP (Certified Associate in Python Programming) (2022)

Experience

onsemi — Scottsdale, Arizona
Artificial Intelligence Engineer Intern — June 2026 – Sep 2026

- Migrated statistical forecasting pipelines of 30+ training, testing, and validation notebooks from Databricks to Snowflake, driving consolidation of ML workflows onto a single enterprise platform.
- Designed and deployed an automated pricing data-collection algorithm that analyzes pricing for thousands of electronic parts daily, now in production and used by the Pricing team.
- Expanded on my product pricing data collection system by developing a prediction algorithm that analyzes variations in pricing data.
- Developed an automated transaction-cleaning system that detects and reprocesses stuck Oracle WMS transactions, enhancing operational efficiency for the Supply Chain team.
- Engineered several other intelligent automation solutions for Supply Chain, Pricing, and Finance teams, leveraging data integration and workflow orchestration to improve operational efficiencies.

Lawnly — Remote
Artificial Intelligence Developer Intern — Oct 2025 – Feb 2026

- Led AI initiatives at an early-stage startup, designing and implementing end-to-end production AI pipelines.
- Implemented intent-classification models to accurately route chatbot queries and improve conversational flow.
- Built privacy-aware data-parsing capabilities to safeguard sensitive user information and ensure compliant data handling.
- Developed secure data pull/push mechanisms that enable the agent to interact with internal systems and execute workflow actions.

Projects

LunchLink — March 2024 - Nov 2024

- ML powered app designed to battle food wastage across my high school district and address existing system inefficiencies.
- Designed and developed a RAG (Retrieval-Augmented Generative Model) -powered chatbot to assist our high school's lunch team in analyzing student feedback.
- Currently being used by our high school's nutrition staff.

SmartGen — Aug 2024 - June 2025

- Developed a ML model utilizing Gradient-boosted machine learning (LightGBM) as a potential solution to California's infamous energy crisis, called the Duck Curve.
- Built an optimized solution for household energy consumption and solar generation. Leveraged matplotlib, seaborn, and Plotly to showcase our solution's practical impact in a variety of data visualizations.
- Developed a UI for users to view daily energy utilization stats, using Python, HTML, CSS, and JavaScript
- Developed a Retrieval Augmented Generation (RAG) Approach to displaying an analysis of our data, using Natural Language Processing (NLP) and Large Language Model (LLM) techniques with the GPT API.
- Presented at 2024 Congressional App Challenge; Placed top 10 in California's tenth congressional district.

Additional Work Experience

Intern / Mentee, Techsophy — Jan 2025 – Aug 2025

- Supported development of AI-driven healthcare applications, including a retrieval-augmented generation (RAG) system enabling medical professionals to query large libraries of research papers, journals, and clinical manuals through a conversational interface.

- Also worked in project-based capacity (03/2024) under direct guidance of one the senior supervisors, where I worked on a RAG model and a Sentiment Analysis Classification Model

Instructor, The Coder School Dec 2024 – Jan 2026

- Taught 2D Game Design in Scratch, Python, HTML/CSS, JavaScript, Lua, and C to K-12 students in the format of both 2-on-1 sessions and lecture classes.
- Mentored Middle and High School students with more advanced projects, such as hackathon submissions, passion projects, and personal websites.

Instructor, Knodemy May 2024 – Dec 2024

- Taught computer science skills to K-12 students such as block-based coding, game design, and basic programming with Python and Java.
- Taught online Fall classes to Pakistani orphans.
- Maintained User Interfaces, improved backend systems and worked on data collection with Python programming.

Research Intern, Cambridge Center for International Research (CCIR) May 2023 – Sep 2023

- Researched, collected data and developed ML models for redshift prediction using Random Forest Regression.
- Wrote a research paper where I used machine learning to estimate photometric redshift from infrared data from the James Webb Space Telescope.
